WHAT ARE **CRYPTOCURRENCIES** AND HOW DO THEY WORK?

“

Cryptocurrencies, or digital currencies, represent a revolution in the way we conceive and carry out financial transactions. They are digital assets that use cryptographic technology to ensure the security of transactions and control the creation of new units. Unlike traditional currencies, such as the dollar or the euro, cryptocurrencies operate entirely online and almost all of them are not issued or regulated by any central government or financial institution.

The best-known cryptocurrency is Bitcoin, which was the first cryptocurrency created in 2009 by an individual or group using the pseudonym Satoshi Nakamoto. Bitcoin served as a prototype for countless other cryptocurrencies that have emerged since then, such as Ethereum, Ripple (XRP), Litecoin and many others.

WHAT IS CRYPTOCURRENCY ARBITRAGE?

Cryptocurrency arbitrage is a trading strategy that involves buying a cryptocurrency on one exchange where it is trading at a lower price and then selling it on another exchange where it is trading at a higher price. This is done to take advantage of price differences between exchanges and make a profit. The practice involves exploiting price movements across different cryptocurrency markets, requiring speed and automation to capture opportunities.

WHAT IS ACTIVE CRYPTOCURRENCY TRADING?

Active Trading is an approach to cryptocurrency trading that involves buying and selling digital assets in short time frames to capitalize on market volatility, rather than simply “buying and holding” (HODL).

Main Features:

- ✓ Frequent Operations – Multiple trades per day, week or month.
- ✓ Focus on Short-Term Gains – Taking advantage of rapid price movements.
- ✓ Use of Technical and Fundamental Analysis – Charts, indicators and market news.
- ✓ Varied Strategies – Scalping, day trading, swing trading and position trading.
- ✓ Adjusted Risk Management – Stop-loss, take-profit and controlled leverage.

Advantages of Active Crypto Trading

- ✓ Quick Profit Potential – Take advantage of high volatility.
- ✓ Flexibility – Can be done anywhere, 24/7.
- ✓ Opportunities in Bull and Bear Markets – Profit in both rising and falling markets.

Practical Example: AI + Humans in Action (Scenario: BTC rises 5% in 1 hour after positive news)

AI Detects

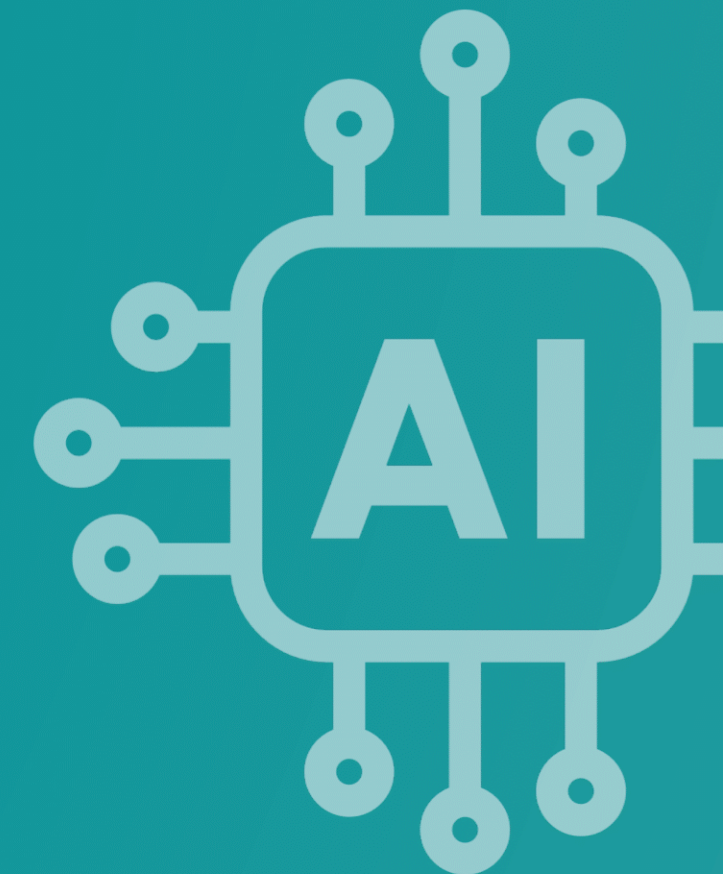

- Abnormal increase in volume in futures.
- Negative funding rate (indicating overbuying).

Traders Validate

- Is the news really true or is it just passing FOMO?
- They decide to reduce positions before a possible correction.

Result

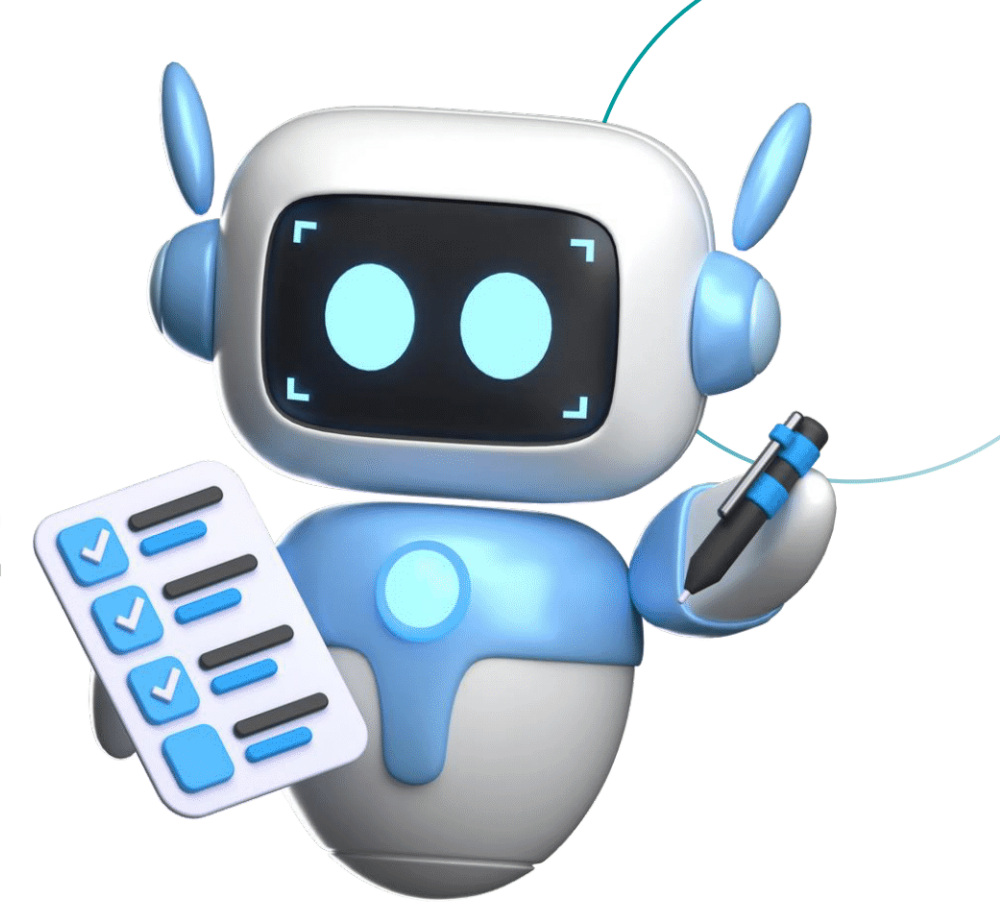

- Optimized profit (AI captured the initial movement).
- Controlled risk (humans avoided sudden reversal).
